

# What's your **RISK?**

## Your risk results

	You	Your partner
Age:	47	43
Gender:		
Smoking status:		
<b>Combined risk*</b>	<b>Likelihood</b>	
Disability before age 65	52 %	
Critical Illness before 65	37 %	
Dying before age 65	9 %	
Probability of dying, becoming critically ill, or disabled before 65**	69 %	

\*The likelihood of you, your partner or both becoming critically ill, becoming disabled, or dying before age 65. The combined risk is based on the probabilities for two independent lives.

The risk of dying before age 65 is relatively low for many people. Factor in the risk of a disability or a critical illness, however, and the picture changes. Thankfully, recovery is often the outcome. But such events can be devastating to your financial future.
